

Part Three: You created and formed the **Save Endangered Species Alliance**, a non-profit group that is dedicated to creating conservation plans that mitigate (make less severe) adverse (unfavorable) impacts of human activity on biodiversity. Your ultimate goal is to remove endangered species from the Endangered Species List by rebounding populations. A conservation plan is plan of action that your non-profit group will take to rehabilitate and ultimately save a species. Based upon information gained in Part Two, design a conservation plan for the endangered species your group picked. In a report, include the information below:

- a) Why is a conservation plan needed for this species?
- b) What are the two primary dangers to this species?
- c) How will your group monitor and minimize these dangers to your species?
- d) What are two other alternate solutions to helping this species? Why did your group not choose these solutions?
- e) What are some additional measures that your group would need from the federal government and the US Fish and Wildlife Service to make this conservation plan successful?
